cc_trf	<i>cc_trf function</i>
--------	------------------------

Description

This function transforms the predictive ability and its standard error between the observed scale and liability scale `cc_trf(R2,se, K,P)`, where R2 is the R squared value of the model for either observed scale or liability scale, se is the standard error for either observed scale or liability scale, K and P is the prevalence of cases in the population.

Usage

```
cc_trf(R2, se, K, P)
```

References

Lee, S. H., Goddard, M. E., Wray, N. R., and Visscher, P. M. A better coefficient of determination for genetic profile analysis. *Genetic epidemiology*,(2012). 36(3): p. 214-224.

Examples

```
To get the transformed predictive ability
output=cc_trf(0.06, 0.002, 0.05, 0.05)

output$R2l (transformed R2 to liability scale, assuming 0.06 in observed scale)
0.2679337

output$se1 (transformed se to liability scale, assuming 0.002 is observed scale)
0.008931123

output$R2O (transformed R2 to observed scale, assuming 0.06 in liability scale)
0.01343616

output$seO (transformed to in observed scale, assuming 0.002 is liability scale)
0.000447872
```

olkin_beta1_2	<i>olkin_beta1_2 function</i>
---------------	-------------------------------

Description

This function derives Information matrix for β_1^2 and β_2^2 where β_1 and β_2 are regression coefficients from a multiple regression model, i.e. $y = x_1 \cdot \beta_1 + x_2 \cdot \beta_2 + e$, where y , x_1 and x_2 are column-standardised, (i.e. in the context of correlation coefficients, see Olkin and Finn 1995).

Usage

```
olkin_beta1_2(omat, nv)
```

Arguments

omat	3 by 3 matrix having the correlation coefficients between y , x_1 and x_2 , i.e. $\text{omat} = \text{cor}(\text{dat})$ where dat is N by 3 matrix having variables in the order of $\text{cbind}(y, x_1, x_2)$
nv	sample size

References

Olkin, I. and J.D. Finn, Correlations redux. *Psychological Bulletin*, 1995. 118(1): p. 155.

Examples

To get information (variance-covariance) matrix of β_1^2 and β_2^2 where β_1 and β_2 are regression coefficients from a multiple regression model.

```
dat=read.table("test_ukbb_thresholds_scaled") (see example files)
omat=cor(dat)[1:3,1:3]
omat
1.0000000 0.1958636 0.1970060
0.1958636 1.0000000 0.9981003
0.1970060 0.9981003 1.0000000
```

```
nv=length(dat$V1)
output=olkin_beta1_2(omat,nv)
output
```

```
output$info (2x2 information (variance-covariance) matrix)
0.04146276 0.08158261
0.08158261 0.16111124
```

```
output$var1 (variance of  $\beta_1^2$ )
0.04146276
```

```
output$var2 (variance of  $\beta_2^2$ )
0.1611112
```

```
output$var1_2 (variance of difference between  $\beta_1^2$  and  $\beta_2^2$ )
0.03940878
```

olkin_beta_inf	<i>olkin_beta_inf</i> function
----------------	--------------------------------

Description

This function derives Information matrix for β_1 and β_2 where β_1 and β_2 are regression coefficients from a multiple regression model, i.e. $y = x_1 \cdot \beta_1 + x_2 \cdot \beta_2 + e$, where y , x_1 and x_2 are column-standardised (see Olkin and Finn 1995).

Usage

```
olkin_beta_inf(omat, nv)
```

Arguments

omat	3 by 3 matrix having the correlation coefficients between y , x_1 and x_2 , i.e. $\text{omat}=\text{cor}(\text{dat})$ where dat is N by 3 matrix having variables in the order of $\text{cbind}(y, x_1, x_2)$
nv	sample size

References

Olkin, I. and J.D. Finn, Correlations redux. Psychological Bulletin, 1995. 118(1): p. 155.

Examples

To get information (variance-covariance) matrix of β_1^2 and β_2^2 where β_1 and 2 are regression coefficients from a multiple regression model.

```
dat=read.table("test_ukbb_thresholds_scaled") (see example files)
omat=cor(dat)[1:3,1:3]
omat
1.0000000 0.1958636 0.1970060
0.1958636 1.0000000 0.9981003
0.1970060 0.9981003 1.0000000

nv=length(dat$V1)
output=olkin_beta_inf(omat,nv)
output

output$info (2x2 information (variance-covariance) matrix)
0.2531406 -0.2526212
-0.2526212 0.2530269

output$var1 (variance of  $\beta_1^2$ )
0.2531406

output$var2 (variance of  $\beta_2^2$ )
0.2530269

output$var1_2 (variance of difference between  $\beta_1^2$  and  $\beta_2^2$ )
1.01141
```

r2_diff

r2_diff function

Description

This function estimates $\text{var}(R^2(y \sim x[,v1]) - R^2(y \sim x[,v2]))$ where R^2 is the R squared value of the model, y is N by 1 matrix having the dependent variable, and x is N by M matrix having M explanatory variables. $v1$ or $v2$ indicates the i th column in the x matrix ($v1$ or $v2$ can be multiple values between 1 - M , see Arguments below)

Usage

```
r2_diff(dat, v1, v2, nv)
```

Arguments

dat	N by $(M+1)$ matrix having variables in the order of <code>cbind(y,x)</code>
v1	This can be set as <code>v1=c(1)</code> or <code>v1=c(1,2)</code>
v2	This can be set as <code>v2=c(2)</code> , <code>v2=c(3)</code> , <code>v2=c(1,3)</code> or <code>v2=c(3,4)</code>
nv	sample size

Examples

To get the test statistics for the difference between $R2(y \sim x[,v1])$ and $R2(y \sim x[,v2])$. (here we define $R2_1 = R2(y \sim x[,v1])$ and $R2_2 = R2(y \sim x[,v2])$)

```
dat=read.table("test_ukbb_thresholds_scaled") (see example files)
nv=length(dat$V1)
v1=c(1)
v2=c(2)
output=r2_diff(dat,v1,v2,nv)
output

r2redux output

output$var1 (variance of R2_1)
0.0001437583

output$var2 (variance of R2_2)

-0.0005574975

```

r2_enrich	<i>r2_enrich</i>
-----------	------------------

Description

This function estimates $\text{var}(t1/(t1+t2))$ where $t1 = R2(y \sim x[,v1] + x[,v2]) - R2(y \sim x[,v1])$ and $t2 = R2(y \sim x[,v1] + x[,v2]) - R2(y \sim x[,v2])$ where $R2$ is the R squared value of the model, y is N by 1 matrix having the dependent variable, and x is N by M matrix having M explanatory variables. $v1$ or $v2$ indicates the i th column in the x matrix ($v1$ or $v2$ should be a single interger between $1 - M$, see Arguments below)

Usage

```
r2_enrich(dat, v1, v2, nv, expl)
```

Arguments

dat	N by $(M+1)$ matrix having variables in the order of <code>cbind(y,x)</code>
nv	sample size
expl	The expectation of the ratio (e.g. # SNPs for the genomic region of interest / total # SNPs in genomic partitioning)
v1/v2	These can be set as $v1=1$ and $v2=2$, $v1=2$ and $v2=1$, $v1=3$ and $v2=2$, or any combination as long as the value is between $1 - M$

Examples

```

To get test statistics for the ratio, i.e.  $t1/(t1+t2)$ .
t1 = R2(y~x[,v1]+x[,v2]) - R2(y~x[,v1]) and
t2 = R2(y~x[,v1]+x[,v2]) - R2(y~x[,v2])
(here we define R2_1=R2(y~x[,v1]), R2_2=R2(y~x[,v2]), R2_12=R2(y~x[,v1]+x[,v2]))

dat=read.table("test_ukbb_enrichment_choles") (see example file)
nv=length(dat$V1)
v1=c(1)
v2=c(2)
expected_ratio=0.04 (# SNPs for the regulatory/total # SNPs)
output=r2_enrich(dat,v1,v2,nv,expected_ratio)
output

```

```

r2_enrich_beta

r2_enrich_beta

Description

This function estimates $\text{var}(t1/(t1+t2))$ where $t1 = \text{beta1}^2$ and $t2 = \text{beta2}^2$, and beta1 and 2 are regression coefficients from a multiple regression model, i.e. $y = x1 \cdot \text{beta1} + x2 \cdot \text{beta2} + e$, where y , $x1$ and $x2$ are column-standardised (see Olkin and Finn 1995). y is N by 1 matrix having the dependent variable, and $x1$ is N by 1 matrix having the i th explanatory variables. $x2$ is N by 1 matrix having the j th explanatory variables. $v1$ and $v2$ indicates the i th and j th column in the data ($v1$ or $v2$ should be a single interger between $1 - M$, see Arguments below). Note that *r2_enrich* (above) and *r2_enrich_beta* is equivalent (identical p-value derived).

Usage

```
r2_enrich_beta(dat, v1, v2, nv, expl)
```

Arguments

dat	N by (M+1) matrix having variables in the order of cbind(y,x)
nv	sample size
expl	The expectation of the ratio (e.g. ratio of # SNPs in genomic partitioning)
v1/v2	These can be set as v1=1 and v2=2, v1=2 and v2=1, v1=3 and v2=2, or any combination as long as the value is between 1 - M

References

-0.1450549

```

r2_var

r2_var function

Description

This function estimates $\text{var}(R^2(y \sim x[,v1]))$ where R^2 is the R squared value of the model, where R^2 is the R squared value of the model, y is N by 1 matrix having the dependent variable, and x is N by M matrix having M explanatory variables. $v1$ indicates the i th column in the x matrix ($v1$ can be multiple values between $1 - M$, see Arguments below)

Usage

```
r2_var(dat, v1, nv)
```

Arguments

dat	N by $(M+1)$ matrix having variables in the order of <code>cbind(y,x)</code>
v1	This can be set as <code>v1=c(1)</code> , <code>v1=c(1,2)</code> or possibly with more values
nv	sample size

Examples

```

To get the test statistics for  $R^2(y \sim x[,v1])$ 

dat=read.table("test_ukbb_thresholds_scaled") (see example file)
nv=length(dat$V1)

```

```

v1=c(1)
output=r2_var(dat,v1,nv)

r2redux output

output$var (variance of R2)
0.0001437583

output$r2_based_p (P-value under the null hypothesis, i.e. R2=0)
1.213645e-10
